MSP Deployment Guide

Worry-Free Business Security Services → Vision One Standard Endpoint Protection

Deployment-script approach — validated end-to-end, single launch, zero manual steps

Overview

This package automates migration from Worry-Free Business Security Services (WFBS-SVC) to Trend Vision One Endpoint Security with Standard Endpoint Protection (SEP). One elevated launch performs removal, cleanup, an automatic mid-migration reboot, and SEP deployment. Success is declared only when the SEP services (tmlisten and ntrtscan) are installed and running — an endpoint with only Endpoint Basecamp is NOT a completed migration.

Phase	Name	What happens
PRE	.NET 3.5	Checks NetFx3; installs via DISM if missing; reboots and resumes if required.
1	WFBS removal	Detects ntrtscan, runs SCUT -noinstall (20–35 min; progress logged every 5 min; 60-min watchdog), waits until the WFBS service and directory are gone, force-deletes leftovers, removes WFBS registry remnants, reboots.
2	SEP deployment	Resumes automatically at startup (SYSTEM scheduled task). Waits for network, re-checks for WFBS remnants, then runs V1_Deploy.ps1: downloads the installer from Vision One, installs with the full package, waits until SEP services are RUNNING.

WARN	THE ENDPOINT RESTARTS AUTOMATICALLY. The script always reboots the machine once (after WFBS removal, with a 30-second warning message), and a second time only if .NET 3.5 had to be installed. Schedule migrations in a maintenance window and notify end users — unsaved work on the endpoint will be lost.

INFO	The script survives reboots via a Windows Scheduled Task (V1Migration, SYSTEM, at startup). It registers the task before rebooting and removes it on completion or fatal error.

Package Contents

File / folder	Edit?	Purpose
V1_Migrate.bat	No	Main migration script. Run this.
V1_Deploy.ps1	Replace per tenant	Vision One deployment script. TENANT-SPECIFIC — regenerate for every customer tenant (see Step 2).
WFBS\SCUT.exe (+ SCUT.exe.config)	No	WFBS removal tool. Bundled once; not tenant-specific.

WARN	V1_Migrate.bat, V1_Deploy.ps1, and the WFBS\ folder must stay in the same directory. The script locates the other files relative to its own path (%~dp0).

Prerequisites

Requirement	Details
Vision One tenant	Active subscription with Endpoint Security enabled.
SEP instance (required)	A Standard Endpoint Protection Manager instance MUST be provisioned in the tenant before generating the deployment script — without it, the script deploys

Requirement	Details
	sensor-only agents. Create it in Vision One: Service Management > Product Instance > Add > Standard Endpoint Protection. Guide: https://docs.trendmicro.com/en-us/documentation/article/trend-vision-one-product-instance
Target OS	Windows 10/11 or Server 2016/2019/2022 (64-bit).
Run as	Local Administrator (auto-elevates via UAC if launched unprivileged) or SYSTEM (RMM).
Internet access	Outbound HTTPS/443 to Trend Micro cloud. No inbound rules required. See Network Requirements.
PowerShell	5.1 (inbox on all supported Windows). PowerShell 7 is not required.

Step 1 — Download SCUT

1. Log in to the Trend Micro Partner Portal (partner.trendmicro.com).
2. Open Support > Diagnostics Tools.
3. Download the WFBSS / WFBS SCUT Tool.
4. Extract into a folder named WFBS\ next to V1_Migrate.bat (SCUT.exe and SCUT.exe.config).

Step 2 — Generate the Deployment Script (per tenant)

V1_Deploy.ps1 embeds the customer's company ID and agent tokens. It must be generated from each customer's own Vision One console:

1. Confirm a Standard Endpoint Protection Manager instance exists in the tenant. If not, create one first: Service Management > Product Instance > Add > Standard Endpoint Protection (provisioning takes a few minutes). How-to: https://docs.trendmicro.com/en-us/documentation/article/trend-vision-one-product-instance
2. Log in to the customer's Vision One console.
3. Go to Endpoint Security > Endpoint Inventory > Agent Installer.
4. Select Windows and choose the Deployment Script option — with Standard Endpoint Protection included (the agent group must be tied to a Protection Manager).
5. Download the script and save it as V1_Deploy.ps1, replacing the bundled copy.
6. Recommended: in the downloaded script, find the 'Check SEP is installed' section and change $MAX_RETRY = 30 to $MAX_RETRY = 120. SEP components download after registration and can take 10–20 minutes; the default 5-minute wait reports failure prematurely.

CRIT	Do not reuse one tenant's V1_Deploy.ps1 for another customer. Endpoints would register to the wrong tenant.

Step 3 — Run (interactive)

```
cd <package folder>
V1_Migrate.bat        (CMD)
.\V1_Migrate.bat      (PowerShell)
```

Then walk away. The machine reboots once mid-migration and resumes automatically. Total runtime is typically 30–40 minutes, dominated by SCUT.

Step 4 — Deploy via RMM (ConnectWise, Datto, NinjaOne, N-able, Kaseya, etc.)

The script is RMM-friendly: it runs non-interactively as SYSTEM, logs to a fixed path, uses exit codes, and survives its own reboot without RMM help. The general pattern:

1. Package: zip the folder (V1_Migrate.bat + tenant's V1_Deploy.ps1 + WFBS\). One package per customer tenant.
2. Push: transfer the zip to the endpoint (e.g., C:\Temp) using the RMM file-transfer facility, and expand it.
3. Execute: run the bat as SYSTEM with a script/command step. Example command line:

```
powershell -NoProfile -Command "Expand-Archive C:\Temp\WF_migration.zip C:
\Temp\WF_migration -Force;
  Start-Process cmd -ArgumentList '/c C:\Temp\WF_migration\V1_Migrate.bat' -Wait"
```

4. Expect the reboot: Phase 1 ends by rebooting the endpoint. The RMM job will report the agent went offline — this is normal. Do NOT configure the RMM to block or suppress reboots for this job, and do not re-run the script on reboot (it resumes itself via its own scheduled task).
5. Verify with a follow-up script (run 60–90 minutes after launch, or on next check-in):

```
$log = 'C:\Windows\Temp\V1Deploy\Logs\migration.log'
$sep = (Get-Service tmlisten,ntrtscan -ErrorAction SilentlyContinue | Where-Object Status -eq
'Running').Count
if ($sep -eq 2 -and (Select-String 'Standard Endpoint Protection installed' $log -Quiet))
{ 'MIGRATION OK'; exit 0 }
elseif (Select-String 'FATAL' $log -Quiet) { 'MIGRATION FAILED - see log'; exit 1 }
else { 'MIGRATION IN PROGRESS'; exit 2 }
```

INFO	Success signal for RMM monitors: both tmlisten and ntrtscan services Running AND the log line 'Standard Endpoint Protection installed'. Exit 0 from V1_Migrate.bat alone is not sufficient if you launched it fire-and-forget before the reboot.

WARN	Do not schedule the same package twice on one endpoint (e.g., an RMM retry policy firing during the post-reboot phase). Concurrent instances conflict during SCUT. If a retry is needed, first delete the V1Migration scheduled task and the C:\Windows\Temp\V1Deploy folder.

Monitoring and Logs

Log	Path
Migration summary	C:\Windows\Temp\V1Deploy\Logs\migration.log
Verbose output	C:\Windows\Temp\V1Deploy\Logs\migration_verbose.log
SCUT output	C:\Windows\Temp\V1Deploy\Logs\scut_output.log
Deployment script transcript	C:\Windows\System32\config\systemprofile\AppData\Roaming\Trend Micro\V1ES\v1es_install.log (SYSTEM context; under %APPDATA% if run interactively)
Basecamp agent log	C:\Program Files (x86)\Trend Micro\Endpoint Basecamp\log\EndpointBasecamp.log

Live monitoring on the endpoint:

```
Get-Content C:\Windows\Temp\V1Deploy\Logs\migration.log -Tail 5 -Wait
```

Network Requirements

Outbound HTTPS/443 only. Key US-region FQDNs (full list: Vision One console firewall exceptions or docs.trendmicro.com 'United States - firewall exceptions'):

- api-us1.xbc.trendmicro.com, wsc-us1.xbc.trendmicro.com — agent gateway / websocket
- endpointpolicy-cdn-us1.xbc.trendmicro.com, release-us1.mgcp.trendmicro.com — policy and package download
- iaus.activeupdate.trendmicro.com, osce14-p.activeupdate.trendmicro.com, activeupdate.trendmicro.com — pattern/engine updates
- licenseupdate.trendmicro.com, osce14.icrc.trendmicro.com, osce14-0-en.url.trendmicro.com — activation and Smart Protection

INFO	Verify DNS on the endpoint first. Cloud VMs behind VPC resolvers may fail to resolve Trend Micro CDN names — add a public secondary DNS (e.g., 8.8.8.8) if needed.

Troubleshooting

Symptom	Cause / fix
Log: FATAL: ntrtscan service still present after 300s	SCUT did not finish removal. Re-run the bat. If it repeats, run WFBS\SCUT.exe -noinstall manually and review scut_output.log / ComUnist.log.
Console: 'Worry Free Business Security Service detected' / 'Unable to enable protection features'	WFBS registry remnants on the endpoint. Re-run the bat — the Phase 2 pre-flight deletes them (PC-cillinNTCorp, OfficeScan, OSCEUpdater, WFBSSUpdater) and re-runs deployment.
Deployment script exit 1 after 'The agent is registered'	SEP components still downloading past the wait window, or the deployment script was generated without SEP. Confirm Step 2 (Protection Manager / SEP included) and the $MAX_RETRY = 120 edit.
Endpoint shows only Basecamp, no SEP services	Deployment script generated without Standard Endpoint Protection, or endpoint cannot reach the download FQDNs. Check Step 2 and Network Requirements.
Need to remove a deployed agent (rollback / retest)	Use the V1ES Uninstall Tool WITH its JWT token file (--jwt <token file>) downloaded from the Vision One console. Without the token, agent self-protection blocks every local removal method.
Retry blocked by stale state	Delete the scheduled task (schtasks /delete /tn V1Migration /f) and the C:\Windows\Temp\V1Deploy folder, then re-run.
Log: FATAL: DISM failed (WSUS/GPO-managed endpoints)	.NET 3.5 Features-on-Demand blocked by policy. Enable the GPO 'Specify settings for optional component installation and component repair' (download from Windows Update), or pre-install .NET 3.5 via DISM with /Source from install media, then re-run.
Deployment transcript: 'Failed to download the installer'	Endpoint cannot reach the XBC gateway. Check DNS (nslookup api-<region>.xbc.trendmicro.com), firewall 443, and clock accuracy (TLS fails on large clock skew). Proxy environments: set $PROXY_ADDR_PORT (and credentials if needed) at the top of V1_Deploy.ps1 — the script has native proxy support.
Log: FATAL: SCUT exceeded 60 min	Genuine SCUT hang (rare; normal is 20–35 min). Review Logs\scut_output.log and ComUnist.log in the SCUT staging folder, reboot the endpoint, clear stale state, and re-run. Never launch a second SCUT while one is running.
Log: FATAL: Could not delete Security Agent directory (locked files)	WFBS driver still holds files. Reboot the endpoint, then re-run the bat — the pre-flight deletes the directory once unlocked.

Symptom	Cause / fix
Console shows two entries for the same endpoint	The old WFBS-era or a prior failed registration is still listed. Judge migration status only by the newest entry; delete stale entries in Endpoint Inventory to avoid confusion and licensing noise.
Wrong product: on-prem Worry-Free Standard/Advanced	This package removes Worry-Free Business Security SERVICES (SaaS) only. The bundled WFBSS SCUT does not uninstall on-prem WFBS Standard/Advanced — those need the on-prem uninstaller or the WFBS on-prem removal tool first.
Installer errors 1618 / install blocked at Phase 2	Another MSI transaction or a pending Windows reboot. Start migrations from a freshly rebooted endpoint; avoid scheduling during patch windows.
Garbled timestamps in migration.log	Cosmetic only. The logger parses the US date format; non-US system locales scramble the displayed date but affect nothing functional.
